                                                                                                                                                                                                                                               The present sequence is a compound which binds to thrombopoietin (TPO) receptor (TR). The compound can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting

                          The present sequence is a compound which binds to thrombopoietin (TPO) receptor (TR). It has a molecular weight of <a href="R000 Da">R000 Da</a>, and a binding affinity to TR as expressed by an IC50 of no more than about 100 mum. The compound (especially if modified, see features table) can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting TPO receptors on living cells
                                                                                                                                                                                                                                                                                                                                                               Thrombopoietin receptor-binding/activating peptide(s) and peptide mimetic(s) - useful in treatment of haematological disorders, esp thrombocytopenia resulting from chemotherapy, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Dower WJ,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is a peptide which binds to thrombopoietin (TPO) receptor (TR). The compound can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting TPO receptors on living cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Thrombopoietin receptor-binding/activating peptide(s) and peptide mimetic(s) - useful in treatment of haematological disorders, esp thrombocytopenia resulting from chemotherapy, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Haematology;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present peptide binds the thrombopoietin receptor (TR), has a molecular weight of less than 8000 Da and a TR binding affinity as expressed by an IC50 of no more than about 100 microM. It can be used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          resulting from chemotherapy, radiation therapy or bone marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor - useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-JUN-1996;

                                                                                               The present peptide, which binds the thrombopoietin receptor (TR), can used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia resulting from chemotherapy, radiation therapy or bon marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent cell lines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     thrombocytopaenia resulting from chemotherapy, radiation therapy or marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent cell lines
                                                                                                                                                                                                                                        Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor - useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        haematological disorder; thrombocytopaenia; chemotherapy; radiation therapy; bone marrow transfusion; diagnosis; signal transduction; receptor activation; cell culture.

                                                                                                                                                                                 The present peptide, which binds the thrombopoietin receptor (TR), c used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia resulting from chemotherapy, radiation therapy or marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent cell lines
                                                                                                                                                                                                                                                                                                                Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor - useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAW35400 standard; peptide;

                                                                                                                                                                                The present peptide binds the thrombopoietin receptor (TR), has a molecular weight of less than 8000 Da and a TR binding affinity as expressed by an IC50 of no more than about 100 microM. It can be used to treat disorders which are susceptible to treatment with a thrombopoietin agoniet, preferably haematological disorders and thrombocytopaenia
                                                                                                                                                                                                                                                                                 Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor - useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, etc.
                                                                                                                                                                                                                                                                                                                                                            Dower WJ,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, c and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an PC domain (rather than a Pab domain) can provide a longer half-life or incorporate functions such as PC receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     inhibitor; erythropoietin; thrombopoietin; interleukin 1;
cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor;

                                                                                                                                                                                                                of activating thrombopoletin receptors in cells comprise contacting the cells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such as that due to chemotherapy, radiation therapy or bone-marrow transplantation and to prevent thrombocytopenia in patients at risk. The sequences are used to treat and prevent haematological disorders including thrombocytopenia and platelet disorders. They are used in vitro as unique tools for understanding the biological role of thrombopoletin (TPO) and to develop other compounds that bind to and activate the TPO receptor. The peptides can be used to detect TPO receptors on living cells and fixed cells, in biological fluids, in tissue homogenates, and in purified or natural biological materials. They may also be used for in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             07-JUN-1995;

Methods CC of activating thrombopoietin receptors in cells comprise contacting the CC cells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such CC as that due to chemotherapy, radiation therapy or bone-marrow transplantation and to prevent thrombocytopenia in patients at risk. The CC including thrombocytopenia and prevent disorders. They are used in vitro CC including thrombocytopenia and platelet disorders. They are used in vitro CC including thrombocytopenia and platelet disorders. They are used in vitro CC including thrombocytopenia and platelet disorders. They are used in vitro CC espicor. The peptides can be used to detect TPO receptors on living CC receptor. The peptides can be used to detect TPO receptors on living CC receptor. The peptides can be used to detect TPO receptors on living CC in purified or natural biological materials. They may also be used for in Situ staining, fluorescence-activated cell sorting, Western blotting and CC enzyme-linked immunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed committed progenitors alone or in conjunction with additional cytokines

                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                         cc bind to and activate the human thrombopoletin receptor (TPO-R). Methods co factivating thrombopoletin receptors in cells comprise contacting the ccells with effective amounts of peptides and peptide mimetics attached to factivating the effective amounts of peptides and peptide mimetics attached to calls with effective amounts of peptides and peptide mimetics attached to graphilic polymers. The methods are used to treat thrombocytopenia such cc transplantation and to prevent thrombocytopenia in patients at risk. The crimchopism of the peptides are used in vitro cincluding thrombocytopenia and platelet disorders. They are used in vitro cas unique tools for understanding the biological role of thrombopietin cc annique tools for understanding the biological role of thrombopietin cc receptor. The peptides can be used to detect TPO receptors on living calls and fixed cells, in biological fluids, in tissue homogenates, and conjunction the standing, fluorescence-activated cell sorting, Western blotting and crivate immunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed committed committed or in conjunction with additional cytokines

The present invention describes a vehicle-peptide molecule (I) or its CC multimers. (I) can have antiinflammatory, antiitumour, immunosuppressive, CC cytostatic, antirheumatic, antiinfertility, haemostatic, ophthalmological, CC antianaemic, anorectic, antiinfertility, haemostatic, dermatological and neuroprotective activities. (I) can be used as a therapeutic or CC prophylactic agent as well as for screening purposes. (I) is useful for CC diagnosing diseases characterised by dysfunction of their associated CC protein of interest, for identifying normal or abnormal proteins of interest, as a part of diagnostic kit to detect the presence of their CC proteins of interest in a biological sample. Additionally, (I) is useful CC retains of interest in a biological sample. Additionally, (I) is useful CC retains of interest in a biological sample. Additionally, (I) is useful CC composens of interest in a biological sample. Additionally, (I) is useful CC retains of interest in a biological sample. Additionally, (I) is useful CC composens of the composens of the composens of the composens of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition o
                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                          This invention relates to novel mammalian CDR mimetibodies, specific CC portions or variants thereof. Specifically, it refers to an antibody CC fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which CC itself comprises at least one human framework region and at least one CC ligand binding region (LBR). The present invention describes human CC mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic CC plants and animals. Furthermore, the CDR mimetibody is useful for CC preparing compositions for modulating, treating or reducing the symptoms CC of immune, cardiovascular, infectious, malignant and/ or neurologic CC diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, CC cardiant, antimicrobial, cytostatic and neuroprotective activities. This captile sequence is a TPD mimetic peptide sequence used to make a
                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mimetic; CDR mimetibody; gene therapy; transgenic; immune; cardiovascular; infectious; malignant; neurologic disease; anaemia; immunomodulator; cardiant; antimicrobial; cytostatic; neuroprotective;

In addition, the disclosed sequences may prove useful for gene therapy. The CH1-deleted mimetibody is useful for diagnosing or treating a disease condition in a cell, tissue, organ or animal, specifically for modulating, treating, treating, preventing the incidence or reducing the symptoms of an immune, cardiovascular (for example arrhythmia, hypertension or heart failure), or neurodegenerative (for example multiple sclerosis, dementia or Alzheimer's disease) diseases of disorders, anaemia, cancerous conditions, or infectious diseases of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CH1 deleted mimetibody; immunosuppressive; cardiovascular; cardiant; hypotensive; neuroprotective; nootropic; antibacterial; virucide; fungicide; gene therapy; immune disorder; cardiovascular disease; arrhythmia; hypertension; heart failure; neurodegenerative; multiple sclerosis; dementia; Alzheimer's disease; anaemia; cancerous condition; infectious disease; bacterial infection;

                                                                  The present sequence is a compound which binds to thrombopoietin (TPO) receptor (TR). It has a molecular weight of <a lequence 10 a, and a binding affinity to TR as expressed by an IC50 of no more than about 100 mum. The compound (especially if modified, see features table) can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. The peptide may also be used to maintrain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting TPO receptors on living cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAW09456;

                                                                                                                                                                                                                                                                                                                                                                                                                                            The present peptide binds the thrombopoietin receptor (TR), has a molecular weight of less than 8000 Da and a TR binding affinity as expressed by an IC50 of no more than about 100 microM. It can be used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombopytopaenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         haematological disorder; thrombocytopaenia; chemotherapy; radiation therapy; bone marrow transfusion; diagnosis; signal transduction; receptor activation; cell culture.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          p), and p4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently linkers; and a, b, of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an FC domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as FC receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB18955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EFO; TFO; CTLA4; mimetic; IL-1; TWF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; thrombolial growth factor; matrix metalloproteinase; asthma; thrombolial growth factor; matrix metalloproteinase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         23-OCT-1998;

                                                                                                 transplantation and to prevent thrombocytopenia in patients at risk. The sequences are used to treat and prevent haematological disorders including thrombocytopenia and platelet disorders. They are used in vitro as unique tools for understranding the biological role of thrombopoietin (TPO) and to develop other compounds that bind to and activate the TPO receptor. The peptides can be used to detect TPO receptors on living cells and fixed cells, in biological fluids, in tissue homogenates, and in purified or natural biological materials. They may also be used for in situ staining, fluorescence-activated cell sorting, Western blotting and enzyme-linked immunosorbent assay (ELISA). In addition, the peptides can be used for in vitro expansion of megakaryocytes and their committed progenitors alone or in conjunction with additional cytokines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             haemostatic; thrombocytopenia; chemotherapy; radiation therapy; ELISA; bone marrow transplantation; haematological disorder; platelet disorder; bone marrow transplantation; haematological disorder; platelet disorder; enzyme-linked immunosorbent assay; in situ staining; biological fluid; tissue homogenate; fluorescence-activated cell sorting; Western blotting; in vitro expansion; megakaryocyte; Headpiece Dimer gene; lacI gene.
                                                                                                                                                                                                                                                                                                                       Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that bind to and activate the human thrombopoietin receptor (TPO-R). Methods of activating thrombopoietin receptors in cells comprise contacting the cells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such as that due to chemotherapy, radiation therapy or bone-marrow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Activating thrombopoietin receptors in cells, used to treat thrombocytopenia and hematological disorders, comprises contacting cells with peptides and peptide mimetics attached to hydrophilic polymers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  01-MAR-2000; 2000US-00516704.

                                                                                                                                                                                                                                       CC multimers. (1) can have antiinflammatory, antitumour, immunosuppressive, CC cyrostatic, antirheumatic, antiinfertility, haemostatic, ophthalmological, CC antianaemic, anorectic, antiinfertility, haemostatic, dermatological and neuroprotective activities. (1) can be used as a therapeutic or prophylactic agent as well as for screening purposes. (1) is useful for CC diagnosing diseases characterised by dysfunction of their associated CC protein of interest, for identifying normal or abnormal proteins of CC interest, as a part of diagnostic kit to detect the presence of their CC proteins of interest in a biological sample. Additionally, (1) is useful CC proteins of interest in a biological sample. Additionally, (1) is useful CC retating inflammatory and autoimmune diseases, tumour growth, cancer, cc infertility, and neurological degenerative diseases. (1), comprising EPO-CC minetic compounds are useful for treating disorders characterised by low cred blood cell levels such as anaemia. The TPO-mimetic comprising CC compounds are useful for treating conditions that involve an existing compounds are useful for treating conditions that involve an existing compounds are useful for treating conditions that involve an existing conditions that involve an existing conditions that involve an existing compounds are useful in thrombocytopaenia, aplastic anaemia, metastatic cumour which result in thrombocytopaenia, aplastic anaemia, metastatic cancer which result in thrombocytopaenia, systemic lupus erythematosus, cancer and conditions that involve an expected megastaryocyte/platelet et deficiency or an expected megastaryocyte/platelet compounds and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly and anomaly an

CC plants and animals. Furthermore, the CDR mimetibodies symptoms or variants thereof. Specifically, it refers to an antibody CC fragment where a protein has been inserted into, or replaces a portion CC of, one or more CDR regions, such that each CDR minetibody comprises at least one portion of a heavy chain or light chain variable region, which CC ligand binding region (LBR). The present invention describes human CC mimetibodies, including modified immunoglobulins and cleavage products CC that can be useful in gene therapy and the generation of transgenic CC plants and animals. Furthermore, the CDR mimetibody is useful for CC preparing compositions for modulating, treating or reducing the symptoms CC diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, CC cardiant, antimicrobial, cytostatic and neuroprotective activities. This compositions is a TPO mimetic peptide sequence used to make a CC mimetibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 25

This invention relates to CH1 deleted mimetibodies (and the DNA sequences CC which encode them), compositions, methods and uses. The invention may be CC useful for the development of compounds with an osteopathic, cardiovascular-Gen, dermatological-Gen, auditory, endocrine-Gen, CC gastrointestinal-Gen, gynaecological-Gen, hepatotropic, haemostatic, CC immunnomodulator, antiallergic, muscular-Gen, cytostatic, cantiniflammatory, neuroleptic, ophthalmological, nephrotropic or CC antiinflammatory, neuroleptic, ophthalmological, nephrotropic or CC respiratory-Gen activity acting as a tumour necrosis factor (TNF)-CC modulator or cytokine-agonist. The methods and compositions of the CR reatment of diseases or conditions associated with aberrant expression CC or activity of the CH1 deleted mimetibody, such as a bone or joint, CC cardiovascular, dental or oral, dermatological, ear, nose or throat, CC endocrine, metabolic, gastrointestinal, gynaecological, hepatic, obstetric, haematologic, immunological, allergic, infectious, obstetric, psychiatric, renal or pulmonary disorders. The present CC gediatric, psychiatric, renal or pulmonary disorders. The present crimentibody of the creation of a sequence is that of a peptide which may be used during the creation of a creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of a composition of the creation of the

                          The present sequence is a compound which binds to thrombopoietin (TPO) receptor (TR). It has a molecular weight of < 8000 Da, and a binding affinity to TR as expressed by an IC50 of no more than about 100 mum. compound (especially if modified, see features table) can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bon marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting TPO receptors on living cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Haematology; thrombocytopenia; TPO; TR; proliferation;

                                                                                                                     The present peptide binds the thrombopoietin receptor (TR), has a molecular weight of less than 8000 Da and a TR binding affinity as expressed by an IC50 of no more than about 100 microM. It can be used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent
                                                                                                                                                                                                                                                            Peptides and peptide mimetics which bind to thrombopoietin receptor - useful in treatmedisorders, esp. thrombocytopenia resulting

                                                                  S
                                                                                                                                                                                                        Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that control of activating thrombopoietin receptor (TPO-R). Methods of activating thrombopoietin receptors in cells comprise contacting the cells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such transplantation and to prevent thrombocytopenia in patients at risk. The sequences are used to treat and prevent haematological disorders including thrombocytopenia and platelet disorders. They are used in vitro as unique tools for understanding the biological role of thrombopoietin (TPD) and to develop other compounds that bind to and activate the TPO receptor. The peptides can be used to detect TPO receptors on living cells and fixed cells, in biological materials. They may also be used for in purified or natural biological materials. They may also be used for in

The compound can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting TPO receptors on living cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Thrombopoietin receptor-binding/activating peptide(s) and peptide mimetic(s) - useful in treatment of haematological disorders, esp thrombocytopenia resulting from chemotherapy, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present peptide binds the thrombopoietin receptor (TR), has a molecular weight of less than 8000 Da and a TR binding affinity as expressed by an IC50 of no more than about 100 microw. It can be used treat disorders which are susceptible to treatment with a thrombopoiet agonist, preferably haematological disorders and thrombocycopaenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          resulting from chemotherapy, radiation therapy or bone marrow transfusions. It can also be used diagnostically, e.g. to investigate th mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           07-JUN-1995;

It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent cell lines
                                                                Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor - useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, e
